

Create **lightbox** image effects in **iWeb** generated websites with **Site Lighter**

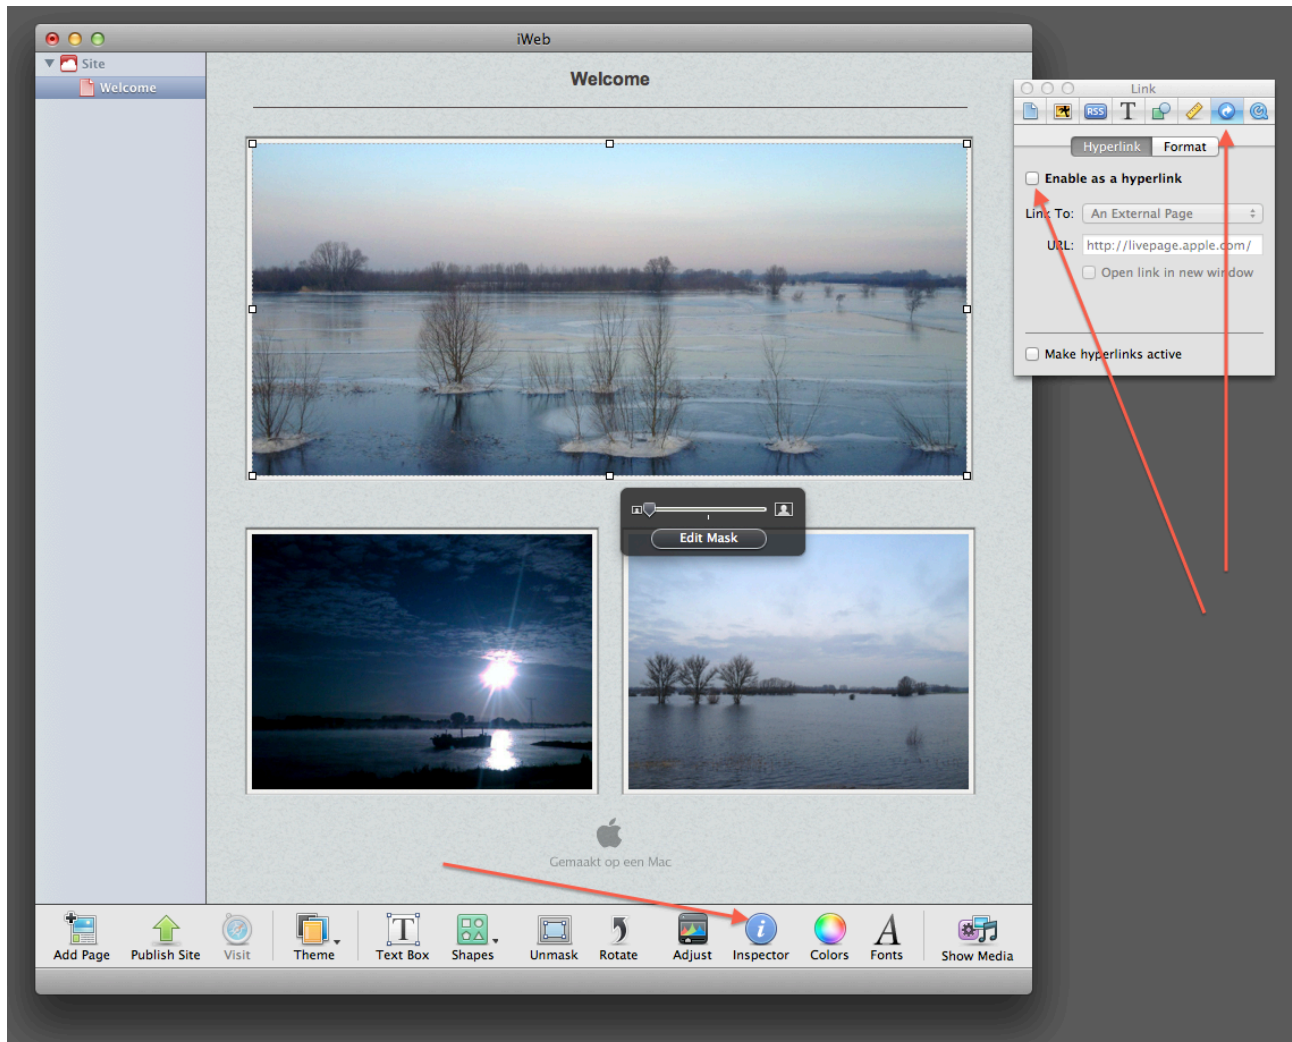

Creating Lightbox popup's in your iWeb site takes a few steps. I will show you in a small tutorial.

1. First step is to set up pictures in your webpage which you want to have a lightbox popup effect. For example like this.

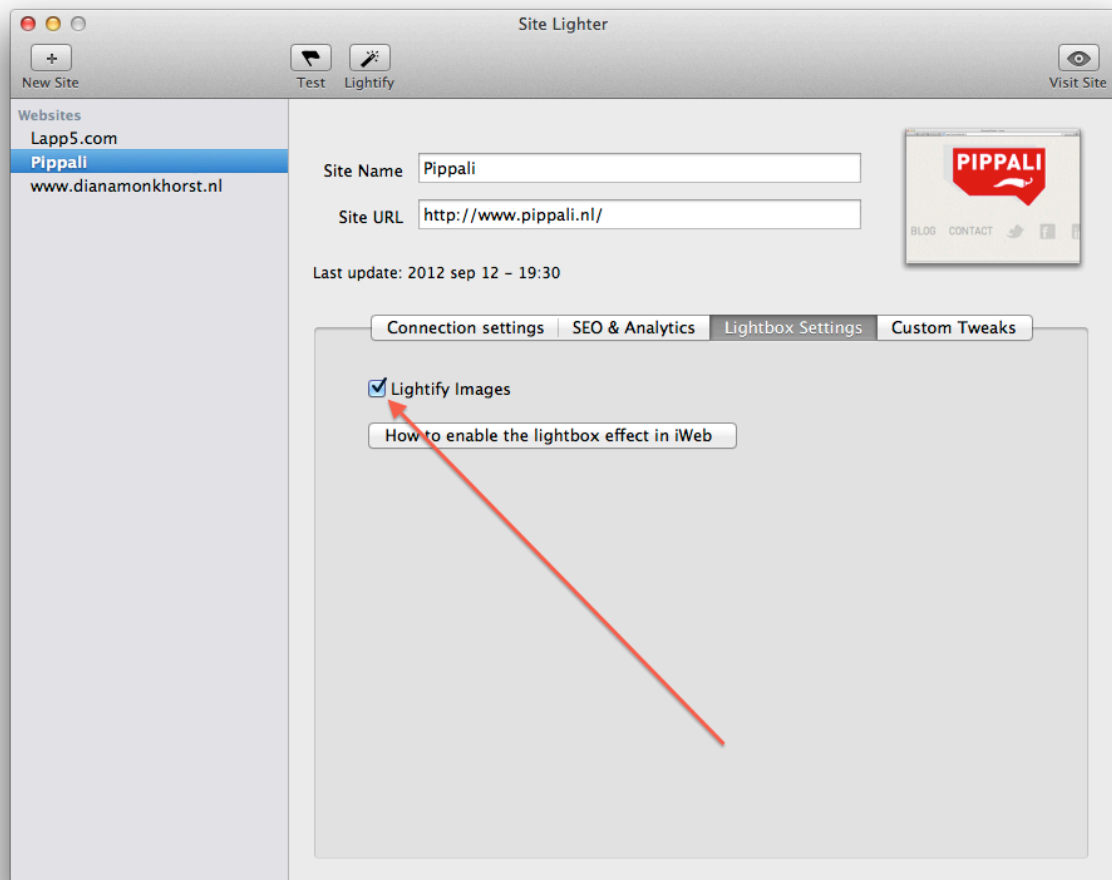

2. Next step is to select a picture and create a link to the original image file. So select the picture and click on the inspector icon. If your inspector disappears click the icon again. It will turn up again. Now click the link icon in your inspector and tick “enable as a link”.

3. Next thing to do in this link inspector is to change to linked to select box to “A file”. After you do this you will instantly get an Open File Dialog. Use this to select your original image file and click open.
4. You have now created a link to the original file. When you have done this for all your images you must publish your website.

5. You have finished the iWeb part of this tutorial. Open Site Lighter and make sure you have setup a valid and testen site with the same publishing settings as your iWeb site. Also make sure you have enabled Lightbox in the Lightbox tab.

6. Last step is to just click “Lightify” in the toolbar. When this is finished your website will have nice Lightbox popup’s.
